

Financial Forecasting Model

A fully linked 3-statement financial model with revenue forecasting and Best/Base/Worst case scenario planning — built for a UK FMCG Cash-and-Carry Distribution business, modeled on the cost structure and reporting style used at Dhamecha Group.

Overview

This model combines a driver-based 3-statement forecast (Income Statement, Balance Sheet, Cash Flow) with a dedicated scenario planning layer, so the same underlying assumptions can be stress-tested across Worst, Base, and Best case outcomes — a core FP&A deliverable for board reporting and budget planning.

Structure

Tab	Purpose
Assumptions	Base case drivers: growth, margins, working capital days, tax, interest
Income Statement	Revenue through Net Income, FY2024A\u2013FY2028E
Balance Sheet	Fully linked; balances to \u00a30 across all 5 years
Cash Flow	Operating, investing, financing activities, tied to the Balance Sheet
Scenario Planning	Worst/Base/Best case assumptions and FY2028E output comparison, with chart
Revenue Forecast	Historical + 3-scenario revenue trajectory, charted

Key Features

- **Driver-based, fully linked:** no hardcoded projections — every forecast cell flows from the Assumptions tab
- **Balance sheet integrity:** balance check row confirms the model ties to zero every period

- **Scenario planning:** Worst/Base/Best cases flex growth (16pp) and margins (13pp) off the Base Case, producing a full net income sensitivity range
- **Visual outputs:** bar chart comparing FY2028E Net Income by scenario; line chart of historical + forecast revenue by scenario

Tools Used

- Excel (formulas, driver-based assumptions, scenario sensitivity tables, native charts)
- Financial modeling best practices (color-coded inputs vs. formulas vs. cross-sheet links)

Files

- `financial-forecasting-model.xlsx` — the complete model (6 tabs)

Notes

Illustrative figures based on a mid-size UK FMCG distribution business (~311.8M revenue base year), consistent in scale with the procurement and reporting scope described in professional experience. Adjust the Assumptions or Scenario Planning tabs to re-run under different conditions.
